

Current state of experiment oak plantation sites in the East-European FES

S.Yu. Krasnobaeva – East-European Forestry Experimental Station, a branch of the Russian Research Institute for silviculture and mechanization of forestry, senior researcher, candidate of biological sciences, Kazan, Tatarstan Republic, Russian Federation, krasnobaeva2003@mail.ru

F. S. Iljin – East-European Forestry Experimental Station, a branch of the Russian Research Institute for silviculture and mechanization of forestry, researcher, Kazan, Tatarstan Republic, Russian Federation

N. R. Garipov – East-European Forestry Experimental Station, a branch of the Russian Research Institute for silviculture and mechanization of forestry, researcher, candidate of agricultural sciences, Kazan, Tatarstan Republic, Russian Federation

Key words: oak, forest cultures, seedlings, experimental objects, stand, estimation parameters, reconstruction.

In Tatarstan rehabilitation of oak stands mainly occurs by cultures. Today the analysis of experimental objects, created in different years under the direction of Tatar forest research station on clear cutting and reconstruction areas is very important for assay of effectiveness of technologies and working out of suggestions on reforestation methods. Investigation of modern state of young and middle-age artificial oak stands has shown that they are mostly in satisfactory condition. On base of measurement parameters the etalon stands have been revealed. They are oak cultures, created by industry technology and culture sites in experimental objects on reconstruction of low-price young stands, that appeared on the felled areas and open stands after the felling of dead oak stands.
