Key words: woods of Pinus sibirika and Pinus korai?nsis; Preservation of Pinus sibirika and Pinus korai?nsis; ecological functions; non-timber resources; comprehensive utilization; forest management; reforestation.

The results of the analysis formed the set of measures address the problem of Siberian pine and Korean pine on the basis of the accumulated scientific potential and normative-methodical developments for integrated management of this forests and forest management with application developed in the last decades of the XX century – early XXI century conceptual and methodological foundations of system of forest management and the implementation of silvicultural measures of the content (reproduction, protection, conservation) and use of forests on zonal-typological basis of their differentiation according to the intended purpose. In terms of the legislative and normative-legal regulation of separate blocks of activities lesoustroistva (reforestation, forest care), as well as the protection and use of forests, problems of regulation system of the integrated forest management and maintenance of pine forests, is envisaged to ensure a combination of the development guidance document (or documents), which developed and refined a holistic system of normative regulation of all forestry activities, which is mutually agreed elements in the existing normative legal documents, preferably regional forest areas (developed in accordance with applicable law). Effective implementation of the developed silvicultural measures regulatory regulation of maintenance and use of cedar forests is provided in the development of organizational forms of implementation of the forest management and forest management, mostly on a permanent (indefinite) basis, including and in the form «perpetual lease» of forest land with constant monitoring of their condition, not less than with annual evaluation of the ratio of the changes in connection with logging and other activities, with the target envisaged in the plan (project) development, maintenance and use of the leased forest parcel (or any object of use and maintenance of forests) in the periodic update (adjustment) of the project, excluding at the same time, the deterioration of the targets (except in cases of catastrophic situations – fires, mass pathology, etc.) not related to economic activity.
